

ABSTRACT

An illuminated post system comprising a plurality of fence posts connected by slats to form at least a portion of a fence. Each of the plurality of fence posts including a lighted base member secured to a top portion of the fence posts. Each lighted base member including at least a first recessed portion having a first aperture and an internal light source. The first recessed portion preferably is a generally curvilinear concave shape. Additional apertures can be provided on the lighted base members. The apertures can be various sizes, shapes or designs and may include clear or translucent covers of various colors. Light emitting through the aperture in the recessed portion provides an indirect lighting or glowing effect.
